

# MODULAR PEER REVIEW

WORKING GROUP

APRIL 21, 2026

**PRE**VIEW

**CSF**

# Today

1. Welcome & Framing
2. Building Code Case Study Recap
3. Walkthrough: System Map
4. Exercise: Outcomes & Signals for Modular Review
5. Share Back & Close

# Case Study: Building Code

## Multiple Checks

Reviews involve more than one stage, outcomes were based on purpose of the check getting away from a single binary gate.

## Continuum Based

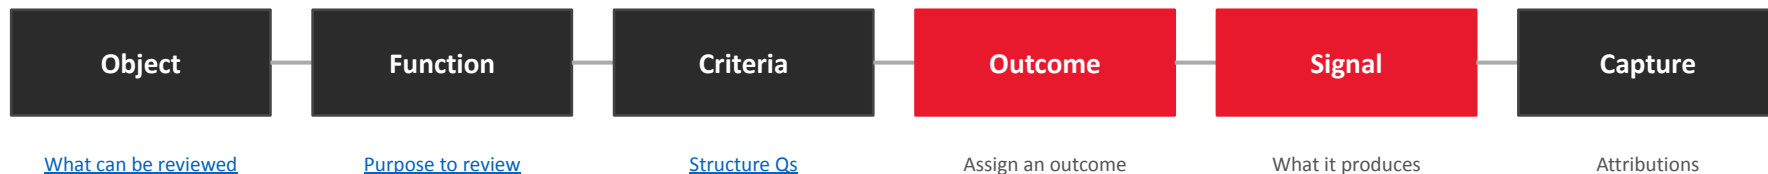

Outcomes are not just pass/fail. They reflect materials, nuance, scope and timing.

## Trust that Travels and Accumulates

Each review adds to a growing signal record that travels with the object over the lifetime of the building.

# Modular Review System Map : Draft

*Our shared group output — a conceptual framework for modular object reviews*

## Outcome

The recorded result of a review process, reflecting how an object was evaluated — where does the object stand right now?

## Signal

The trust signals produced from the review: Rigor, Safety, Reproducibility, Compliance, Fidelity, Decision, Clarity, Maturity.

# Working Group: Exercise 20 Mins

Goal: Test whether we can clearly define what decision is made (Outcome) and what others can trust from it (Signal) when reviewing different objects.

## 1. What works / what breaks

- Provide feedback on the system map. What's working and what breaks when and where?

## 2. Outcome

- Test the “Outcome” layer. How should outcomes change across different objects and review purposes? Capture feedback and questions.

## 3. Signal

- Test the “Signal” layer. How should signals vary across objects and review purposes? Capture feedback and questions.

### As you go Capture:

1. Points of confusion
2. Gaps or overlaps
3. What you would change

# Share Back Instructions

*Nominate a speaker — each group has 2–3 minutes.*

1. What works well? What breaks down?
2. How do you see the role of **outcomes & signals**

# Next Meeting

**May 19**

Return to your subgroup and work with an example/  
use case to perform a modular review on.
